

ABSTRACT OF THE DISCLOSURE

A medical support system for supporting a medical care of a patient includes: a wireless tag carried by the patient; a medical information database for storing medical information of the patient; and a medical support apparatus for communicating with the wireless tag and the medical information database. The medical support apparatus includes: a patient ID acquisition unit for obtaining a patient ID that identifies the patient from the wireless tag when the patient approached the medical support apparatus; a suitability determination unit for referring to the medical information database and determining whether or not the medical support apparatus is suitable for the patient identified by the obtained patient ID; and a warning unit for issuing a warning to the patient when the suitability determination unit determined that the medical support apparatus was unsuitable for the patient.
